真正的年轻化无法通过单一的活性成分实现。我们的按时序方案可以安全地剥离屏障，迫使微通道打开，传递针对性的外泌体信号，并从生物学上封锁真皮。

True rejuvenation cannot be achieved with a single active. Our chronological protocol safely strips the barrier, forces micro-channels open, delivers targeted exosomes signaling, and biologically seals the dermis.

Spongilla Needles 海藻矽针

海藻矽针源于德国多瑙河，是罕见的天然淡水海绵。海藻矽针并不是一根根的针，而是一种高矽质（Silicon，又称硅）的有机钙（Calcium）天然微米海绵晶体。其细胞壁的矽含量占细胞整体重量的4~50%，故称**矽藻**。隐形矽针由肉眼看不到的**海绵丝**与**针状矽骨**组成，因此又称**海绵骨针**。

Badiaga is the Russian name for river sponge. Originated from Danube River, Germany, rare and natural freshwater **spongilla bio-needles** (length 2~2,000um, diameter 20~30um) are complex amalgamates of silky threads of **seaweed sponge** and **silica spicules bones**, arranged into needle-like microscopic crystal pins, therefore aka **Seaweed Spicules**.

Melanin One of the key factors influencing skin tone 影响肤色的成因之一：黑色素

Melanin is produced by melanocytes in the basal layer of the skin and transferred to keratinocytes, moving upwards and eventually shedding naturally with the stratum corneum. Skin color differences mainly come from variations in melanin amount, size, and distribution. Studies show that darker skin contains more melanin, with larger, more dispersed granules that break down more slowly. In addition to these inherent factors, external elements like UV exposure and certain medications can also stimulate melanin production.

黑色素在皮肤基底层的黑色素母细胞中产生，经黑色素细胞传递到角质形成细胞，随着细胞向上移动，最终随角质层自然脱落而消失。肤色差异主要来自黑色素的数量、大小和分布。研究发现，深色肤质的人黑色素更多、颗粒更大，且分解较慢。此外，紫外线、药物等外部因素也会刺激黑色素增加。

Troublesome PIGMENTATION 恼人的各种色斑

Pigmentation spots are areas where uneven melanin distribution causes darker patches on the skin. They can be divided into two types: stable spots and active spots. Stable spots, like moles, age spots, and birthmarks, are less affected by external factors and rarely recur after removal. Active spots, such as freckles, melasma, and post-inflammatory pigmentation, are more sensitive to factors like UV exposure and hormonal changes, with size and color that may vary over time.

色斑是因皮肤黑色素分布不均，在局部形成的色素加深斑点或斑块，主要分为定性斑和活性斑。定性斑性质稳定，不易受外界影响，常见于色素痣、老年斑和胎记，去除后不易复发。活性斑则较易受紫外线、内分泌等因素影响，大小和颜色可能变化，常见如雀斑、黄褐斑和继发性色素沉着。

胶原蛋白是一种结构蛋白，存在于皮肤中并占据很大比例。它为皮肤提供了强度和弹性，有助于保持皮肤的平滑、结实和年轻外观。弹性蛋白是一种蛋白质，它赋予皮肤弹性和回弹性。随着年龄的增长，胶原蛋白和弹性蛋白的产生逐渐减少，同时已有的胶原蛋白逐渐分解，导致皮肤变得松弛、皱纹增多和弹性减弱。过度的紫外线暴露、吸烟、不健康的饮食和缺乏锻炼等因素都可以加速胶原蛋白和弹性蛋白的流失，从而加速肌肤老化。
